Launcher key on chromebook

Mark LaFay among the icons on the left chromebook display is one icon that looks like a grid with nine boxes. This is your app launcher icon that compares to the Windows Start button. When you click the app launcher icon, the app launcher appears, a pop-up window that includes multiple apps. As long as you don't add apps yourself, the only apps that appear here are the default apps that come with your PC and the apps already associated with your Google Account. The app launcher can include up to 16 apps. When you install apps, Chrome OS adds additional windows for your apps. If you have more than 16 apps, horizontal bars appear at the bottom of the screen. These buttons indicate the existence of additional windows for applications. The color of the button indicates which window is active. Click these buttons to move between windows. Organize the app launcher If you want to keep things in a specific order, you will be grateful that you will be able to organize your app launcher if you want. Just click on the application and drag it around the window until it is in the order you want. To move apps between windows in the Apps folder, do the following: Press and hold the app icon you want to move. Drag the icon towards the window where you want to place the selected app. Wait patiently for the window to change. Drop the location you want. When you're done browsing apps, you can close the app launcher by clicking outside or clicking the app launcher icon on your shelf. Photo James Bareham/Verge Hotkeys has always been a favorite of writers, encoders and other fast-track computer users who want to get as much text on screen as possible without having to raise their hands on keyboards. But for Chromebooks, shortcuts can also help new users cope with differences in the design of the Chromebook and other systems, such as Macs and Windows PCs. For example, instead of the usual caps lock key that most keyboards have, Chromebooks have a launcher key used to highlight the launcher (equivalent to the Windows startup disc or the Windows Start menu). If you prefer to revert to Caps Lock (as I usually do), you can use the Alt + Launcher shortcut to change the launcher to caps lock, or combine the launcher and backspace key to delete forward. There are quite a few of these useful keyboard shortcuts and you don't need to know them by heart. Just use the following keyboard combination: Ctrl + Alt + / This will open a window containing all the shortcuts you can use, divided into categories. There's also a search window that lets you search for a close, for example, and you'll find ways to close the current tab or current window simply by using the keyboard. One if you are looking for a shortcut key, start with one search term. When I typed close to the word, I got the answers I needed. But when I typed the phrase close tab, nothing came out because the phrase Close current tab is used in the list of shortcuts. That's it! Vox Media has affiliate partnerships. (Image credit: CC Foto Labs/Shutterstock) Google is rebranding the Search/Launcher key for your Chromebooks like The All Button as they transition to more shortcut functionality to use the key. According to Android Police, The Everything Button, which lives above the left shift and underTab keys, replaces the Caps Lock button with a standard keyboard. Currently, the search or launcher key opens the Chrome OS launcher or initiates a search, depending on the context. Now, Google hopes to move several more hotkeys newly named Everything Button to improve the functionality of its increasingly popular Chrome OS. Meanwhile, Google will continue its Chrome OS 86 update after its launch seemed to suddenly run aground over the last few days. Android Police reports that the latest Chrome OS update introduced a number of new features and improvements - and at least some users say it broke the print feature of the Chromebook and even maybe locked some students completely off their devices. Given the importance of Chromebooks as a cheap solution for school districts, this is obviously a bad thing if it is true. Google apparently took the update off its servers a few days before the update was pushed on all eligible devices before putting it back up on its stable channel this week, perhaps after fixing reported errors. Google has not acknowledged that there is a problem with the OS itself in a statement made by Chrome Unboxed, however, and blames the apparent delay in rolling out an error in the update channel reporting itself, which made it seem as if there were inconsistencies in the update schedule. Google says that the update will be fully rolled out soon and that the apparent delay has nothing to do with the problem with the OS itself, so we need to see if the reported issues - as yet unchecked - become a reality for more users. Chromebooks are now better suited to remote work than ever Although it may take some time, it's quite easy to set up your Chromebook as a developer machine with Linux and programming tools. That's what I do in my CompSci classes, and my Chromebook is easily able to get me through the Computer Science curriculum. Some programming tools work better with function keys on the keyboard, but... there are none of them on the chromebook! No problem, there is a setting that allows keys in the top row of your Chromebook to function as function keys, i.e.: F1, F2, etc... You're going to find it under the covers. Device, keyboard: The screenshot above comes from a Pixelbook, and you'll notice that it says it's holding the startup key. Chromebooks made by Google hardware partners have this keyboard key, but their description is The Keep search key to change the behavior of the top row keys. Of course, Chrome OS, the only thing that is continuous is constant change. Whether you have a launcher key or a search key, you will soon be known as the All key. According to Google Support: All Chromebooks are equipped with the All button. This is one button that will help you find your things quickly. Use this button to search Google, drive, apps, files, and more— all in one place. Do you know this key by a different name? This is the new name for the Launcher or Search button on the Chromebook keyboard. This campaign Launcher's new name was chosen to reflect user feedback, and highlight that Chromebooks have a special button on their keyboards that allows them to search for files, apps, drive, web, and more. Whatever you call it, you can use it to use a specific feature in an integrated development environment for coding. And if you're using other Linux applications, you can find the need for traditional function keys. Updated on Nov 15, 2020 with information about the All button. So there's a small round launcher button on the bottom left of my chrome book, where the old windows start the menu icon earlier. It seems to download all my applications that are not pinned to the bottom bar, I have to go click that thing opens a program where I can enter a search for your app, I know it seems like a small thing, but I really never like to let my hands leave the keyboard, using a touchpad really slows me down. Is it possible to open that start menu launcher keyboard shortcut? As for my Mac Osx I can hit ALT-SPACE and it opens the spotlight in search that does the same thing. Alternatively, is it possible to open that launcher from the command line? because I'm probably already from the command line. Page 2 of 6 comments on Google renaming that keyboard button on Chromebooks, which lives just above the left shift and below the tab. And no, it's not a caps lock. On Chromebooks, it used to be called the Search or Launcher button, but now Google has renamed it as the All button and other shortcuts to make it easier. The news comes courtesy of a low-key announcement made on Google Chromebook community forums, which claims that the new name was chosen based on user feedback to better highlight what the key does. There's not really a special caps lock button for out-of-10 chromebooks. This feature is still there, just changed a separate key combination. Instead, the key in this location works to run the search or access launcher. Given how rare most of us use hats to lock key (including me, and I type/write literally every day), resigning from it better is actually pretty smart – although arguably, it does the same thing the win key would be, and most Chromebooks give up in favor of giant ctrl and bottom keys. And these aren't the only changes to Chromebook keyboards; some models are dedicated to Google Assistant keys, and they also eschew the function keys in the top row of most laptops with other (more useful) commands. Standard Chromebook keyboard layout. In the announcement, Google notes that you can still see references to the launcher in Chrome OS, but seemingly separate from the startup key, which is now the All button. We've also noticed some recent changes to Chromium Gerrit that suggest more keyboard shortcuts can be used all the buttons in the future, so it's a consistent change that Google has to promote, although it may break some shortcuts you would otherwise rely on, such as alt-click. alt-click.
